REC'D 15 APR 2004

WIPO

PCT

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

Warning

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

Notes

- If you need help to fill in this form or you have any questions, please contact the Patent Office on 0645 500505.*
- Write your answers in capital letters using black ink or you may type them.*
- If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.*
- If you have answered 'Yes' Patents Form 7/77 will need to be filed.*
- Once you have filled in the form you must remember to sign and date it.*
- For details of the fee and ways to pay please contact the Patent Office.*

TEA MANUFACTURE

Field of the invention

This invention relates to a process for obtaining cold water infusible or extractable tea
5 and to the products obtained thereby that have improved red colour, infuse faster and have good flavour.

Background and prior art

Leaf tea may be prepared as green leaf tea or black leaf tea. Generally, to prepare
10 black leaf tea, fresh green leaves of the plant *Camellia sinensis* are withered (a process to allow the plucked tea leaves to lose moisture and bring about chemical / biochemical changes especially in aroma), macerated, fermented (in which process enzymes in the tea leaf use atmospheric oxygen to oxidise various substrates to produce coloured products) and then dried at higher temperatures (to stop the
15 enzyme activities). Whereas, green tea is not exposed to the fermentation process and partial fermentation may be used to produce intermediate-type teas known as "oolong" tea.

Tea is consumed as a hot beverage or as a cold beverage (for example iced tea).
20 The numerous compounds in the leaves that give the beverage its unique organoleptic properties are only sparingly soluble in cold water therefore tea is usually infused in water at temperatures close to 100 °C. When cold tea is desired,

the tea leaf is infused in water at about 100 °C and if required chilled it is kept for example in a refrigerator until it is cold. Unfortunately this can take several hours, further the tea solids precipitate out on cooling giving rise to a beverage with a turbid appearance.

5

The cold water soluble teas can also be prepared by spray drying the liquor obtained by extraction of black tea or fibres generated during black tea manufacturing process. However, this process requires high temperatures or treatment with harsh chemicals like alkalis which adversely affect the tea attributes like taste, colour and flavour.

10

Enzymes have been added during the processing of tea to generate cold water infusing teas.

15

Thus, US 4,051,264 (Lipton/Sanderson) discloses a method for making a cold water infusing leaf tea extract. Tea leaves are pre-treated with an enzyme tannase under anaerobic conditions to generate a cold-water infusing tea with good colour, yield and flavour.

20

US 3,812,266 (Sanderson/Coggon) discloses a method that involves converting green tea to black using tannase and natural tea enzymes. The method also includes a tannase pre-treatment step, but in a slurry system, followed by oxidation

However, tannase is an expensive enzyme and is also not legally cleared in several countries for usage in tea.

Apart from the advantages of obtaining cold water infusible tea, an important consideration for the consumer is tea colour, brightness and aroma. Tea colour refers to the colour of the infusion with or without milk. Black tea infusions can range from yellow to red-brown in colour. Teas with bright, red liquor and good aroma are particularly preferred in countries like India and are perceived to be 'strong' teas. It is thus desirable to produce tea with these characteristics.

Apart from red colour, faster infusion of the tea into the water is desirable as consumers perceive faster infusing teas to be strong teas. Thus teas that infuse fast and provide a good red colour are much preferred by consumers and are perceived to be teas with good strength.

There have been attempts to produce teas that have red colour by the addition of ingredients during tea processing.

Thus, US 5863581 (Lipton, Division of Conopco, Inc.) discloses a process for manufacturing a tea product where zeolites are used to generate red coloured teas.

Zeolites are a family of natural and synthetic aluminosilicate water insoluble materials having a negatively charged framework structure with cavities housing alkali metal or alkaline earth metal cations. The framework structure can house water and organic materials. However, the invention does not pertain to cold water infusible tea product.

Tadao Kurata et al in Agr. Biol. Chem, 37 (6), 1471-1477, 1973 discloses that a red pigment is produced at the initial stage of the browning reaction of dehydro-L-ascorbic acid (DHA) with alpha-amino acid. 5-phenyl-3,4-diketo-gamma-butyrolactone, which has the same type of lactone ring structure as dehydro-L-ascorbic acid, is said to give a similar red colour when reacted with alpha-amino acid. The pigment is said to have the same structure as the red pigment that is produced by the oxidation of L-scorbamic acid.

WO01/70038 concerns a process for manufacturing a cold water infusible black leaf tea comprising macerating freshly plucked tea leaves, allowing them to ferment, firing the leaves to arrest fermentation and then drying them to yield black leaf tea. The process is characterised in that the tea leaves are treated with a solubilising compound selected from the group consisting of ascorbic acid, dehydroascorbic acid, L-scorbamic acid or 5-phenyl-3,4-diketo-gamma-butyrolactone, preferably during the maceration step. The black leaf tea so produced is infusible in water at 5

to 100 °C. The teas have a good red colour. The addition of ascorbic acid results in a series of reactions giving a pigment that provides for good red colour.

Apart from ascorbic acid, citric acid is known to be added to soluble tea powders and infusions. Thus US3821440 (Brian Reeve) teaches the addition of citric acid to
5 instant tea prepared by alkaline treatment of tea. Citric acid is used to adjust the pH. US3113028 (Rand Development Corporation) teaches the addition of citric acid or ascorbic acid to a tea concentrate as an acidifying agent. JP01005451 (General Foods Corp.) teaches the addition of citric acid to an aqueous, concentrated black tea solution to adjust the pH. However, the prior art as disclosed above does not
10 teach the use of citric acid during processing of black tea.

SU 1517903 discloses a method to make black tea with improved sensory properties and quality wherein citric acid, ascorbic acid, sucrose, amino acids and caffeine are added together to form a syrup. The syrup is added in two stages -
15 before and after the rolling. Rolling is a step used in making orthodox teas which do not make use of the cut-tear-curl (CTC) step in the processing. Moreover, this invention is not directed towards making teas with red colour and having a fast infusion rate in water and also infuses in cold water.

20 Thus there has been a need to provide for cold water infusible teas that have good red colour and more importantly fast infusion rate in water. The present inventors have now found that one can prepare a black leaf tea that provides a high quality tea

beverage when infused in hot or cold water by treating tea leaves first with any pH lowering agent, preferably citric or malic acid or its salts or their mixtures thereof prior to or at the beginning of the fermentation step followed by treatment with ascorbic acid or its salts or their mixtures thereof. Preferably the ascorbic acid or its salts or their mixtures are added during or after mid-fermentation. The teas are both cold and hot water infusible or extractable. The infusions/extracts show improved red colour and also show good flavour. The rate of infusion is also faster for teas prepared by the process of the invention.

"Tea" for the purposes of the present invention means leaf material from *Camellia sinensis* var. *sinensis* or *Camellia sinensis* var. *assamica*. It also includes rooibos tea obtained from *Aspalathus linearis* however that is a poor source of endogenous fermenting enzymes. "Tea" is also intended to include the product of blending two or more of any of these teas.

"Leaf tea" for the purposes of this invention means a tea product that contains one or more tea origins in an uninfused form.

"Cold water infusible" for the purposes of this invention means giving good colour, flavour and mouthfeel in a short infusion time i.e. less than 10 minutes, but preferably less than 5 minutes at a temperature at or above 5 °C.

"Mid-fermentation" means the point of time at which half of the fermentation time has elapsed.

For the avoidance of doubt the word "comprising" is intended to mean including but not necessarily "consisting of" or "composed of". In other words the listed steps or options need not be exhaustive.

Objects of the Invention

It is an object of the invention to provide for a cold or hot water infusible black tea

10

It is a further object of the invention to provide for a cold or hot water infusible black tea with improved red colour and good flavour.

A further object of the invention is to provide for a cold or hot water infusible tea that

15 infuses quickly into the water.

Definition of the Invention

According to the first aspect of the invention, there is provided a process for manufacturing a black leaf tea comprising the steps of optionally withering freshly plucked tea leaf, macerating, allowing the leaves to ferment, firing the leaves to arrest fermentation and then drying them to yield black leaf tea, the process being characterised in that the tea leaves are treated before fermentation or before mid-

20

fermentation with a pH lowering agent, preferably citric or malic acid or its salts or mixtures thereof, followed by treatment during fermentation with ascorbic acid or its salts or mixtures thereof at mid-fermentation or later in an amount that is sufficient for the black leaf tea to be infusible in water at 5 to 100 °C.

5

The invention also pertains to the tea obtained by this process. The tea so obtained is cold water and hot water infusible/extractable and the infusion/extract shows improved red colour. The tea also infuses quickly into the water.

10 **Detailed Description of the Invention:**

Tea manufacture, especially black tea manufacture, traditionally comprises: withering, macerating, fermenting and firing. Black tea for the purpose of the invention is obtained by the following process.

15 Withering is a process whereby the plucked tea leaves are stored for periods of time (perhaps up to 24 hours), during which they undergo various biochemical and physical changes which often includes a loss of moisture. It is optional but preferred.

20 Maceration follows the withering step, and traditionally the withered leaves are optionally rolled to bruise and crush the leaves i.e. break down the plant tissue structure. This will have the effect of liberating fermentable substrates and

fermenting enzymes from within the plant cells and tissue. Modern tea manufacture usually includes this step however the plant cells and tissue is broken down by passing tea, which has usually been withered, through a cutting machine. Thus for the purpose of the invention the green tea leaves may be macerated using a CTC, ball mill or a grinder or a hammer mill or a LAWRI TM tea processor or a LEGG TM cutting machine or rolled using tea rollers as in orthodox tea processing.

The next step is commonly called fermentation but that is a misnomer. "Fermentation" is commonly used in the context of brewing alcohol to describe the action of exogenous enzymes. However in the tea world it is used to refer to the oxidative and hydrolytic process that tea undergoes when certain endogenous enzymes and substrates are brought together by mechanical disruption of the cells by macerating of the leaves. During this process colourless catechins in the leaves are converted to a complex mixture of yellow and orange to dark-brown substances and producing a large number of aromatic volatile compounds.

The fermented product is fired and dried to give a black leaf tea. The firing involves heating and drying the tea to destroy the fermenting enzymes and thereby arrest fermentation. It results in a reduction of moisture content to below 5%, and also leads to further chemical oxidation and changes in tea aroma. This generally involves exposing the tea to a blast of hot, dry air in a dryer.

The present invention concerns a modification to traditional black tea manufacture.

The modification involves treating the tea leaves before fermentation or before mid-fermentation with a pH lowering agent, preferably citric or malic acid or its salts or

their mixtures thereof, followed by treatment with ascorbic acid or its salts or their

5 mixtures thereof at mid-fermentation or later in order to enhance the infusibility of the black tea in cold water.

The tea leaves are treated with the pH lowering agent, for example citric acid, post plucking but before mid-fermentation, preferably during maceration or at the beginning

10 of fermentation. If the pH lowering agent is citric acid, it is preferably added in an amount of from 0.05 to 5%, more preferably 0.1 to 4%, most preferably 0.1 to 3%

by weight of the tea. The citric acid is preferably added in the form of a solution, preferably an aqueous solution, in single or split doses. The treatment is preferably

given in the form of a spray or dip.

15

The tea leaves are treated with ascorbic acid after treatment with the pH lowering agent, for example citric acid. It is essential that ascorbic acid is applied after the

addition of the pH lowering agent. Preferably the ascorbic acid is added during the mid-fermentation or end-fermentation stage. Ascorbic acid is preferably added in an

20 amount of from 0.1 to 10%, more preferably from 0.1 to 8% and most preferably at a

concentration of from 0.1 to 5% by weight of the tea. The ascorbic acid is preferably

added in the form of a solution, preferably an aqueous solution, in single or split doses. The treatment is preferably given in the form of a spray or dip.

The tea is preferably fermented from 10 minutes to 3 hours at 10 to 60 °C.

5

The tea can be dried using any art-known means, preferably giving leaf tea with a moisture content of less than 5%.

The products obtained by the above process can be used to produce instant tea or for
10 infusing black tea in water at temperatures in the range of 5 to 100 °C. The instant tea can be produced by extracting the tea leaves produced by the above process with boiling water, clarifying the extract, and drying it. The instant tea produced by this method will give higher yields of cold water soluble tea solids having superior red colour and flavour than the instant tea produced by the conventional methods. Water
15 infusions of the tea produced by the process described above in water at temperatures in the range of 5 to 100 °C will give tea with superior colour and flavour:

The black leaf tea prepared by the process of the invention also infuses faster and gives superior red colour in a shorter time than control teas as well as cold water
20 infusible teas prepared by processes outside the invention.

The red colour can be further enhanced by heating the tea leaves with microwaves prior to infusion of the leaf tea to make a tea infusion.

A first preferred embodiment of the process of the invention comprise the steps of:

- 5 (a) macerating green tea leaves after optionally withering the tea leaves
- (b) processing the macerated tea in a conventional manner to obtain black tea, wherein the green tea post plucking is treated first with 0.1 to 5% with the pH-lowering agent, preferably citric acid or its salts or their mixtures thereof in single or split doses at any step up to and including the beginning of
10 fermentation, followed by treatment with 0.1 to 10% ascorbic acid or its salts or their mixtures thereof in single or split doses at mid-fermentation or later
- (c) further processing the tea in a conventional manner to obtain black tea.

The process of the invention shall now be described with reference to the following
15 examples:

EXAMPLES

Comparative Example A

800 grams of withered tea leaf was macerated using four cuts on a CTC. The
20 untreated macerated mass was processed further by fermenting on a continuous fermenting unit for 80 minutes at 25°C, followed by drying on a fluid bed drier at 140 - 150 °C to bring down the moisture to less than 5% on black tea basis.

Comparative Example B

800 grams of withered tea leaf was macerated using two cuts on a CTC followed by 40 minutes fermentation on a continuous fermenting unit and fermenting at 25°C.

- 5 7.2 g ascorbic acid was then added as a 3% solution. Two more cuts were given, after which the treated dhool was fermented for 40 minutes on a continuous fermenting unit followed by drying in a fluidised bed drier at 140 – 150 °C for 20 minutes to bring down the moisture to less than 5% on black tea basis.

10 **Comparative Example C :**

800 grams of withered tea leaf was macerated using two cuts on a CTC. 1.2 g Citric acid was then added as a 0.5% aqueous solution. Two more cuts were given, after which the treated dhool was fermented for 80 minutes on a continuous fermenting unit at 25°C followed by drying in a fluidised bed drier at 140 – 150 °C for 20

- 15 minutes to bring down the moisture to less than 5% on black tea basis.

Comparative Examples D

800 grams of withered tea leaf was macerated using one cut on a CTC. 7.2 g ascorbic acid was added as a 3% solution. Another cut was given, after which the
20 treated dhool was fermented for 40 minutes on a continuous fermenting unit. 1.2 g citric acid was then added as a 0.5% solution and the mass was fermented at 25°C. Two more cuts were then given. The mass was further fermented for 40 minutes on a continuous fermenting unit followed by drying in a fluidised bed drier at 140 – 150 °C for 20 minutes to bring down the moisture to less than 5% on black tea basis.

25

Comparative Example E

800 grams of withered tea leaf was macerated using two cuts on a CTC. A mixture of 0.5% citric acid and 3% ascorbic acid was then added to the mass. Two more cuts were given, after which the treated dhool was fermented for 80 minutes on a

continuous fermenting unit and fermented at 25°C followed by drying in a fluidised bed drier at 140 – 150 °C for 20 minutes to bring down the moisture to less than 5% on black tea basis.

5 **Comparative Example F**

800 grams of withered tea leaf was macerated using two cuts on a CTC followed by 40 minutes fermentation on a continuous fermenting unit and fermenting at 25°C. A mixture of 0.5% citric acid and 3% ascorbic acid was then added. Then two more cuts were given, after which the treated dhool was fermented for 40 minutes on a
10 continuous fermenting unit followed by drying in a fluidised bed drier at 140 – 150°C for 20 minutes to bring down the moisture to less than 5% on black tea basis.

Example 1

15 800 grams of withered tea leaf was macerated using one cut. 1.2 g citric acid was then added as a 0.5% solution. Another cut was given, after which the treated dhool was fermented for 40 minutes on a continuous fermenting unit. 7.2 g ascorbic acid was then added as a 3% solution and fermented at 25°C. Then two more cuts were given. The mass was further fermented for 40 minutes on a continuous fermenting
20 unit followed by drying in a fluidised bed drier at 140 – 150 °C for 20 minutes to bring down the moisture to less than 5% on black tea basis.

Example 2 - preparation of cold water infusions

2 g of black tea samples were infused in 100 ml of water at 25°C for 5 minutes. The
25 solution was filtered to give cold tea infusions and the colour of infusions obtained from Comparative Examples A-F and Example 1 was measured using a Hunter Lab Ultrascan XE™ colorimeter in the transmittance mode. The data is presented in Table 1.

Colour measurements

L*a*b* measurements for colour were carried out on Hunterlab UltraScan XE™ colorimeter under the following conditions:

- 5 Cuvette 2cms (Quartz), Mode Transmittance, Illuminant D65, Observer 10, Scale CIELAB. The reflectance at 520 nm was also determined. 50 ml of the brew was taken in a 2 cm quartz cuvette, transmittance/reflectance was measured under the conditions mentioned above.
- 10 The a* values are reported as these denote redness of the tea. The higher the value, the redder the tea. 520 nm is the wavelength at which the red colour absorbs. The higher the absorbance value the greater the red colour.

Table 1:

Example	a*	Absorbance 520 nm
A	27.7	0.8
B	61.5	2.8
C	37.1	1.0
D	59.8	2.2
E	62.4	3.0
F	62.9	3.0
1	64.1	3.8

15

Example 3 – preparation of hot water infusions

- 136 ml of water was boiled in a saucepan. To the boiling water, 5 g of tea was added and the boiling continued for one minute. 114 ml of boiled milk and 10 g of
- 20 sugar were added and stirred to mix. The mixture was boiled to one rise and then

strained to remove spent tea. The colour of the liquor was measured in reflectance mode at 40 °C in a Hunter Lab Ultrascan XE TM colorimeter. The data is presented in Table 2.

Table 2:

Example	a*
A	11.7
B	17.2
C	13.0
D	17.0
E	17.4
F	17.8
1	18.9

The data in Table 1 and 2 shows that in Example 1, the a* as well as the 520 nm (in Table 1) values have been significantly increased indicating that the infusions have a deeper red colour as compared to Comparative Example A which had not been treated with acid and which has a very pale yellow colour. Addition of only ascorbic acid (Comparative example B) and citric acid (Comparative Example C) does not give teas with as good red colour as the tea of Example 1.

Further, the data clearly shows that the sequence of addition of citric acid and ascorbic acid according to the invention is important. Thus Example 1 is a tea of superior red colour as compared to the teas of Comparative Example D to F.

Difference of greater than one unit in a* value can be easily perceived by human eye and sensory panels.

Rate of Infusion

The rate at which the tea infuses into cold water was also studied. The effect was studied for Comparative Examples A and B and Example 1. The colour of the infusion after 30 seconds, 1, 2, 3, 4 and 5 minutes was determined. The data is presented in Table 3.

Table 3:

Example	Time (minutes)	a*	Absorbance 520nm
A	0.5	5.4	0.30
	1	8.7	0.37
	2	14.0	0.46
	3	19.0	0.56
	4	21.2	0.60
	5	23.6	0.67
B	0.5	49.3	1.30
	1	54.9	1.60
	2	57.6	1.90
	3	60.5	2.40
	4	61.1	2.50
	5	61.9	2.80
1	0.5	57.5	1.80
	1	60.1	2.10
	2	63.3	2.90
	3	63.6	3.10
	4	63.8	3.20
	5	63.7	3.30

The data presented in table 3 shows that the teas prepared by the process of the invention infuse faster and give better red colour within a short period as compared to control teas or teas treated with ascorbic acid.

5

Example 4 - Heat treatment of tea by microwaving and tea infusions prepared from the teas

10

2 g of the black tea of Comparative Examples A and B and Example 1 were microwaved in a glass petri dish for a period of 2 minutes in a conventional microwave. The teas were then used to prepare cold water infusions. The process was as given above. A control black tea that had not been microwaved was used for comparison. The data on the infusions is presented in Table 4.

15

Table 4:

Example	Time (minutes)	a*	Absorbance 520nm
A	0	13.9	0.45
	2	22.0	0.60
B	0	61.2	2.50
	2	64.0	3.20
1	0	63.8	3.10
	2	64.6	3.55

The data presented in Table 4 shows that the red colour can be further enhanced by microwaving the tea prior to preparing the infusions. The process also reduces the microbial load on the black tea.

- 5 It is thus possible by way of the present invention to produce a black leaf tea that infuses quickly in hot or cold water and provides for a good red colour.

CLAIMS

1) A process for manufacturing a cold water soluble black leaf tea comprising the steps of

- 5 (a) optionally withering freshly plucked tea leaf,
 (b) macerating the leaves,
 (c) allowing the leaves to ferment,
 (d) firing the leaves to arrest fermentation and
 (e) then drying them to yield black leaf tea,

10 the process being characterised in that the tea leaves are treated before fermentation or before mid-fermentation with a pH lowering agent, followed by treatment during fermentation with ascorbic acid, salts of ascorbic acid or mixtures thereof at mid-fermentation or later in an amount that is sufficient for the black leaf tea to be infusible in water at 5 to 100 °C.

15

2) A process as claimed in claim 1 wherein the pH lowering agent is citric acid, salts of citric acid, malic acid, salts of malic acid or mixtures thereof.

20 3) A process as claimed in claim 1 or claim 2 wherein the tea leaves are treated with the pH lowering agent during maceration or at the beginning of fermentation

4) A process as claimed in any preceding claim wherein the pH lowering agent is citric acid added in an amount of 0.05 to 5% by weight of the tea.

5) A process as claimed in any one of claim 1 to 3 wherein the pH lowering agent is citric acid added in an amount 0.1 to 4% by weight of the tea.

5 6) A process as claimed in any one of claims 1 to 3 wherein the pH lowering agent is citric acid added in an amount of 0.1 to 3% by weight of the tea.

7) A process as claimed in any preceding claim wherein the pH lowering agent is added in the form of a solution in a single or split doses.

10

8) A process as claimed in claim 7 wherein the solution is an aqueous solution.

9) A process as claimed in any preceding claim wherein the ascorbic acid is added in an amount of 0.1 to 10% by weight of the tea.

15

10) A process as claimed in any one of claims 1 to 8 wherein the ascorbic acid is added in an amount 0.1 to 8% by weight of the tea.

11) A process as claimed in any one of claims 1 to 8 wherein the pH lowering agent is citric acid added in an amount of 0.1 to 5% by weight of the tea.

20

12) A process as claimed in any preceding claim wherein the ascorbic is added in the form of a solution in a single or split doses.

13) A process as claimed in claim 12 wherein the solution is an aqueous solution.

5

14) A process as claimed in any preceding claim wherein the fermentation lasts for 10 minutes to 3 hours at a temperature in the range 10 to 60°C

15) A process as claimed in claim 1 comprising the steps of

- 10 a) macerating green tea leaves after optionally withering the tea leaves
- b) processing the macerated tea leaves in a conventional manner to obtain black tea, wherein the green tea is treated first with 0.1 to 5% by weight of the tea of the pH-lowering agent in single or split doses at any time up to and including the beginning of fermentation, followed by treatment with 0.1 to 10%
- 15 ascorbic acid, salts of ascorbic acid or mixtures thereof in single or split doses from mid-fermentation or later
- c) further processing the tea in a conventional manner to obtain black tea.

16) A process as claimed in claim 15 wherein the pH lowering agent is citric acid,

20 salts of citric acid or mixtures thereof

- 17) A process as claimed in any preceding claim wherein the resulting black tea leaf is heated with microwaves prior to infusion

ABSTRACT

A process for manufacturing a cold water soluble black leaf tea comprises the steps of

- 5 (a) optionally withering freshly plucked tea leaf,
 (b) macerating the leaves,
 (c) allowing the leaves to ferment,
 (d) firing the leaves to arrest fermentation and
 (e) then drying them to yield black leaf tea,

10 the process being characterised in that the tea leaves are treated before fermentation or before mid-fermentation with a pH lowering agent, followed by treatment during fermentation with ascorbic acid, salts of ascorbic acid or mixtures thereof at mid-fermentation or later in an amount that is sufficient for the black leaf tea to be infusible in water at 5 to 100 °C.
